### Summary:

Wheatley Associates are a specialist provider of software solutions for work planning, scheduling, mobile working, physical asset management and UK metering. With customers including some of the most profitable in the UK, they depend on high quality internet connectivity.

Wheatley approached Evolving Networks with a need for a high speed internet connection, with inbuilt resilience, for their offices in rural Suffolk.

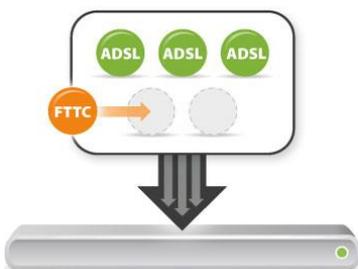

### Bonded Solution:

As Wheatley's offices are in a non FTTC area, it was suggested by Evolving Networks that they combine five ADSL 2+ lines to deliver a bonded internet connection with enough bandwidth and resilience for their business needs.

Proactively monitoring via eView Live ensures all five ADSL services are running at optimum performance levels 24/7 and delivery via the Evolving Networks private network ensures uncontended performance levels over the bonded internet connection.

Wheatley Associates' David Bradbury said "I liked the idea of one company taking ownership of 1) the lines 2) the ISP function and 3) the bonding service, as our previous internet connectivity was split with 2 ISPs & telcos and 1 bonding company with no clear demarcation of who was responsible for performance issues or outages.

"This proved to be beneficial when one of the lines had an intermittent fault (identified using the eView Live facility). Evolving Networks were able to arrange getting the equipment fixed at the exchange and we didn't need to contact anyone else to resolve the problem."

### Benefits of a Bonded Solution:

A bonded ADSL solution allows companies to benefit from increased throughput, failover and resilience by combining multiple ADSL lines.

By bonding internet connections, businesses can access the advantages of new technologies such as FTTC and EFM if available, whilst being safe in the knowledge their connection is future proofed and can be upgraded if new technologies become available to them.
